

Joint Moving Horizon Estimation and Model Predictive Control for Type 1 Diabetes

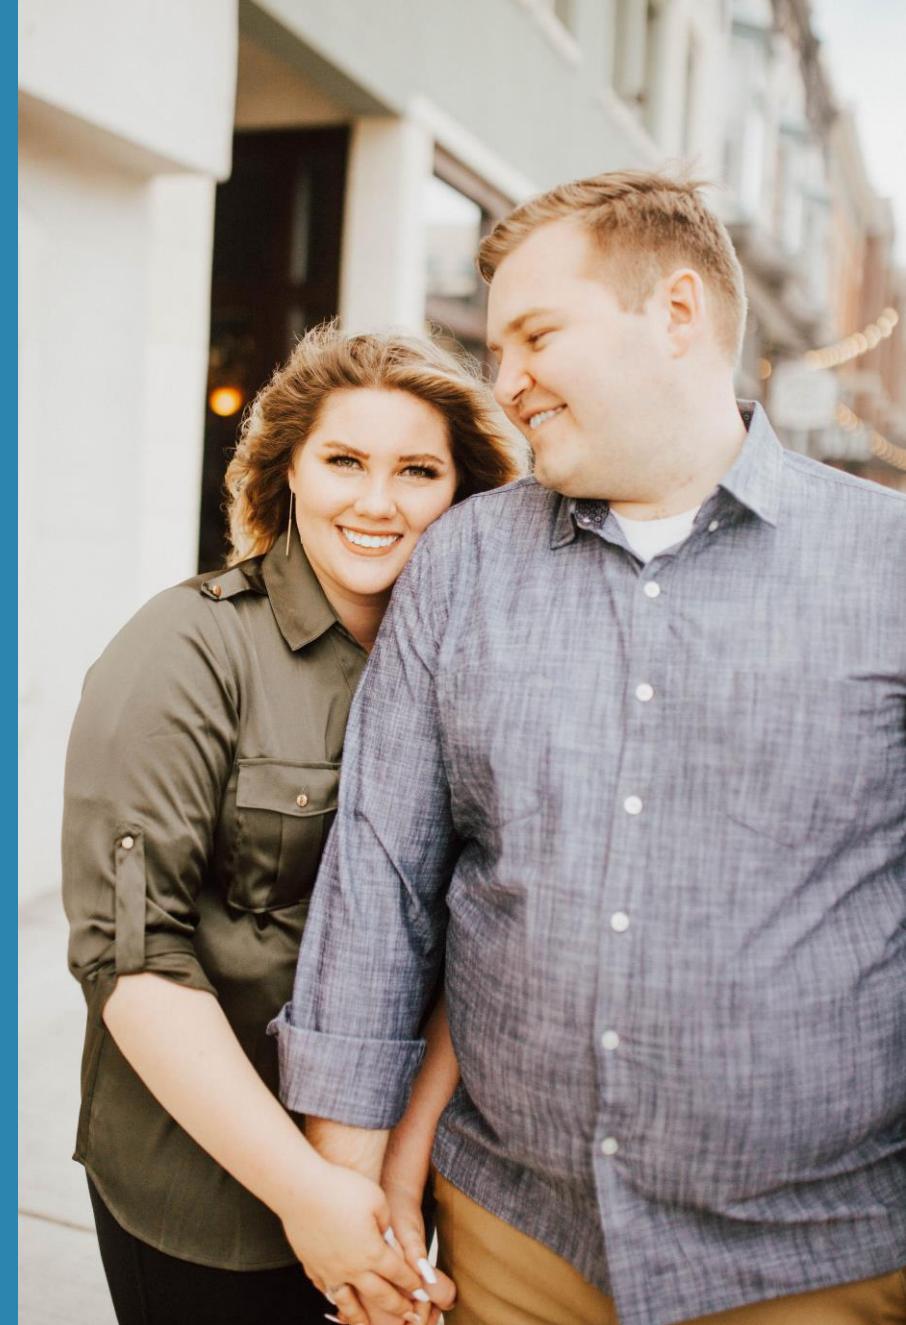

Joshua Hammond
Nathan King

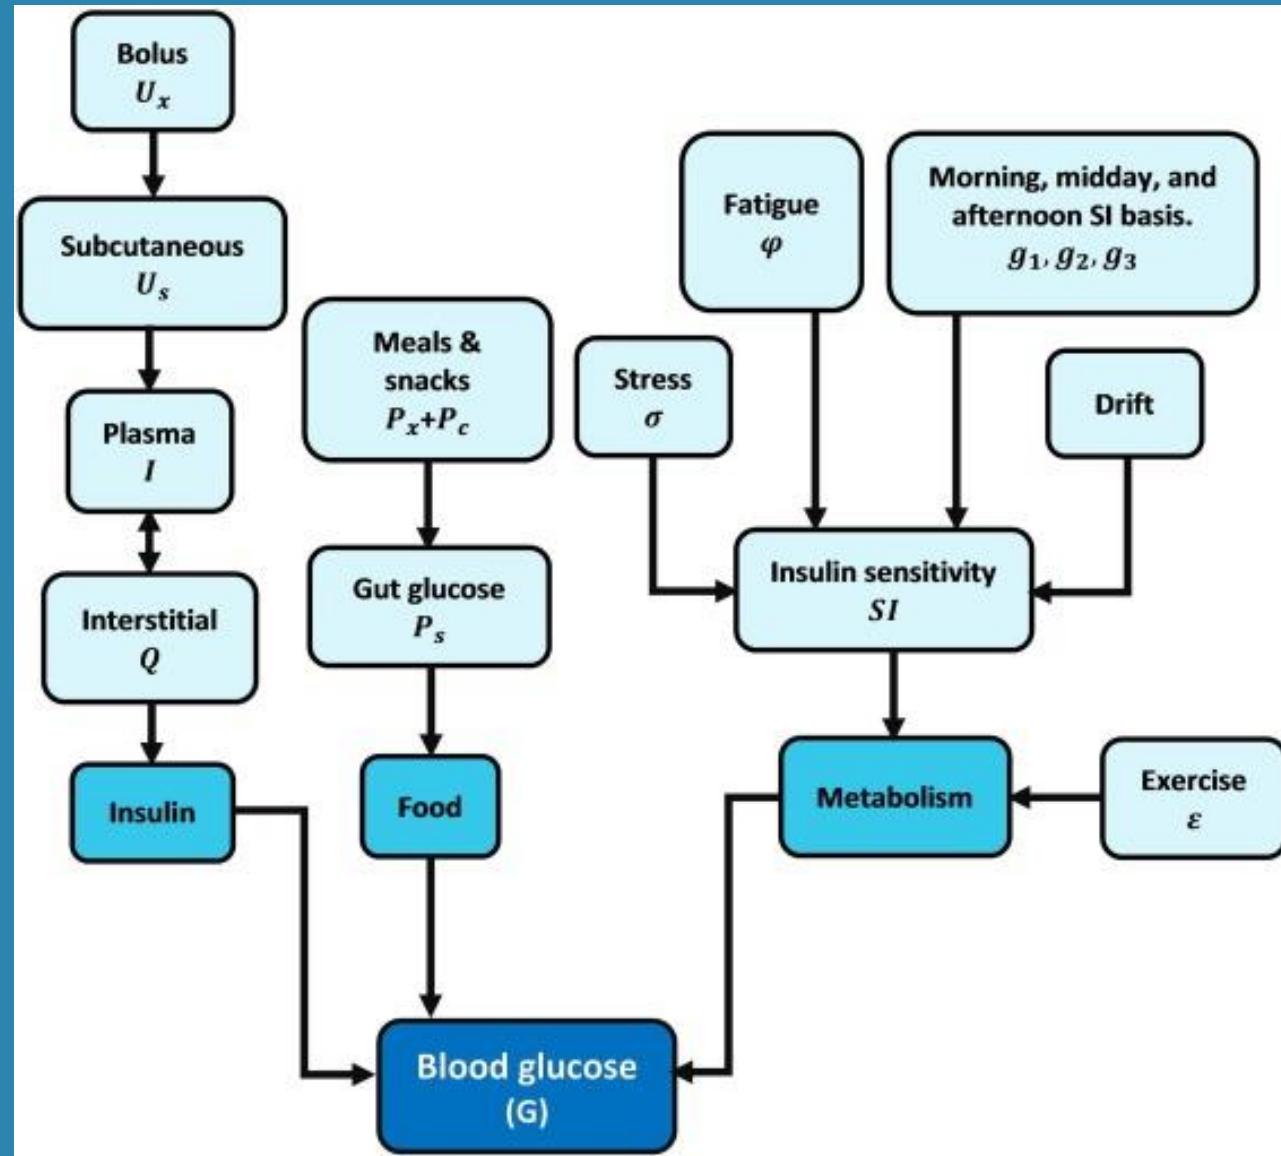

GEKKO
DYNAMIC OPTIMIZATION

Objective:

- i) Proof of concept disturbance and parameter estimation with MHE
- ii) Design an objective function that prioritizes patient safety
 - a) avoid hypoglycemic time
 - b) Target 80 mmol/dL blood glucose

Insulin Dynamics

Bergman Minimum Model

$$\frac{dG}{dt} = -p_1 * (G - bg_s_i * X * G + f * \frac{k_{abs}}{vg} GG + \frac{f}{vg} D$$

$$\frac{dX}{dt} = p_2(I - X)$$

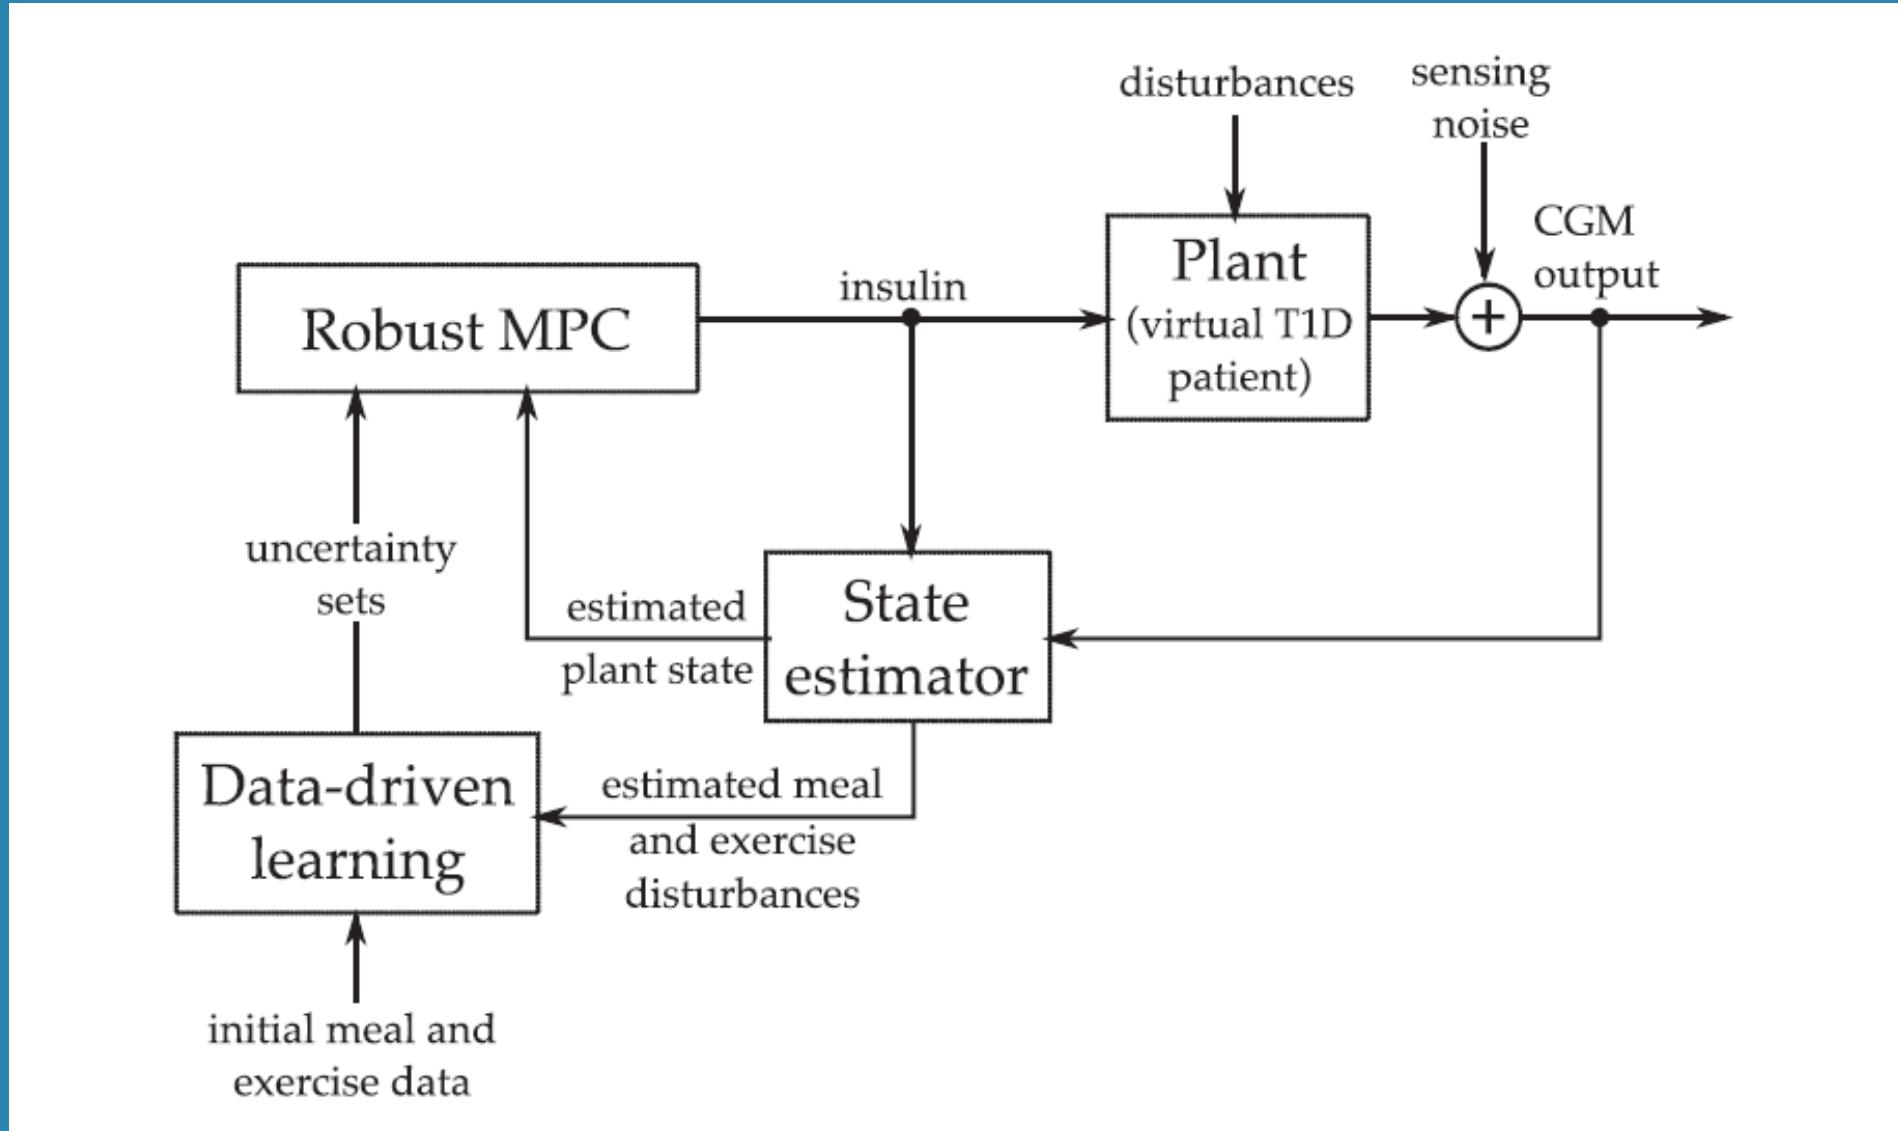

$$\frac{dI}{dt} = -k_e * I * U$$

$$\frac{dS_1}{dt} = U - k_{emp} * S_1$$

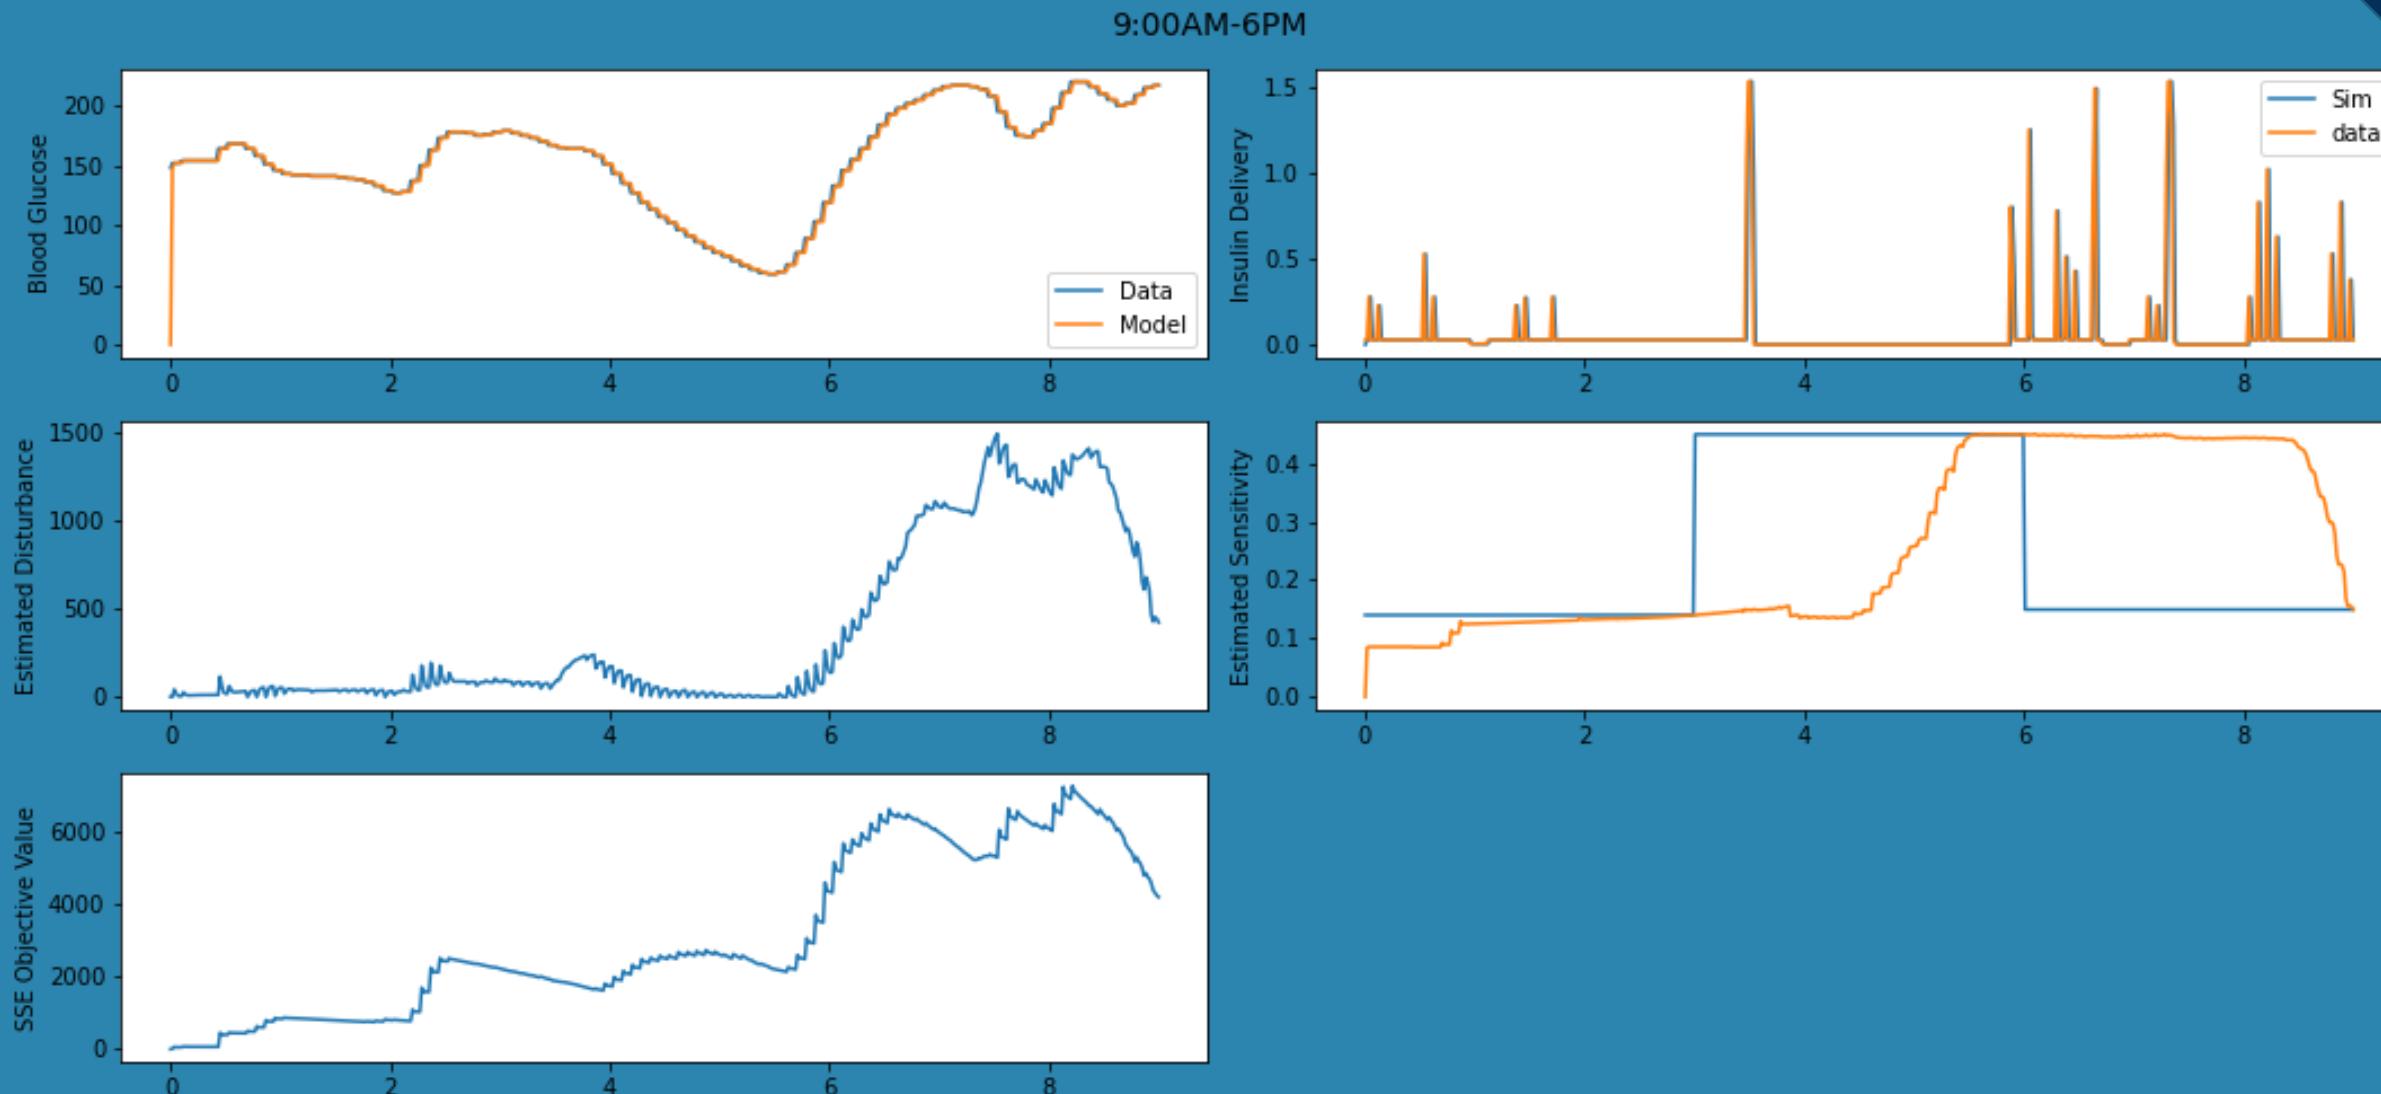

$$\frac{dS_2}{dt} = -k_{emp} * (S_2 - S_1)$$

$$\frac{dGG}{dt} = k_{emp} * S_2 - k_{abs} * GG$$

Moving Horizon Estimation

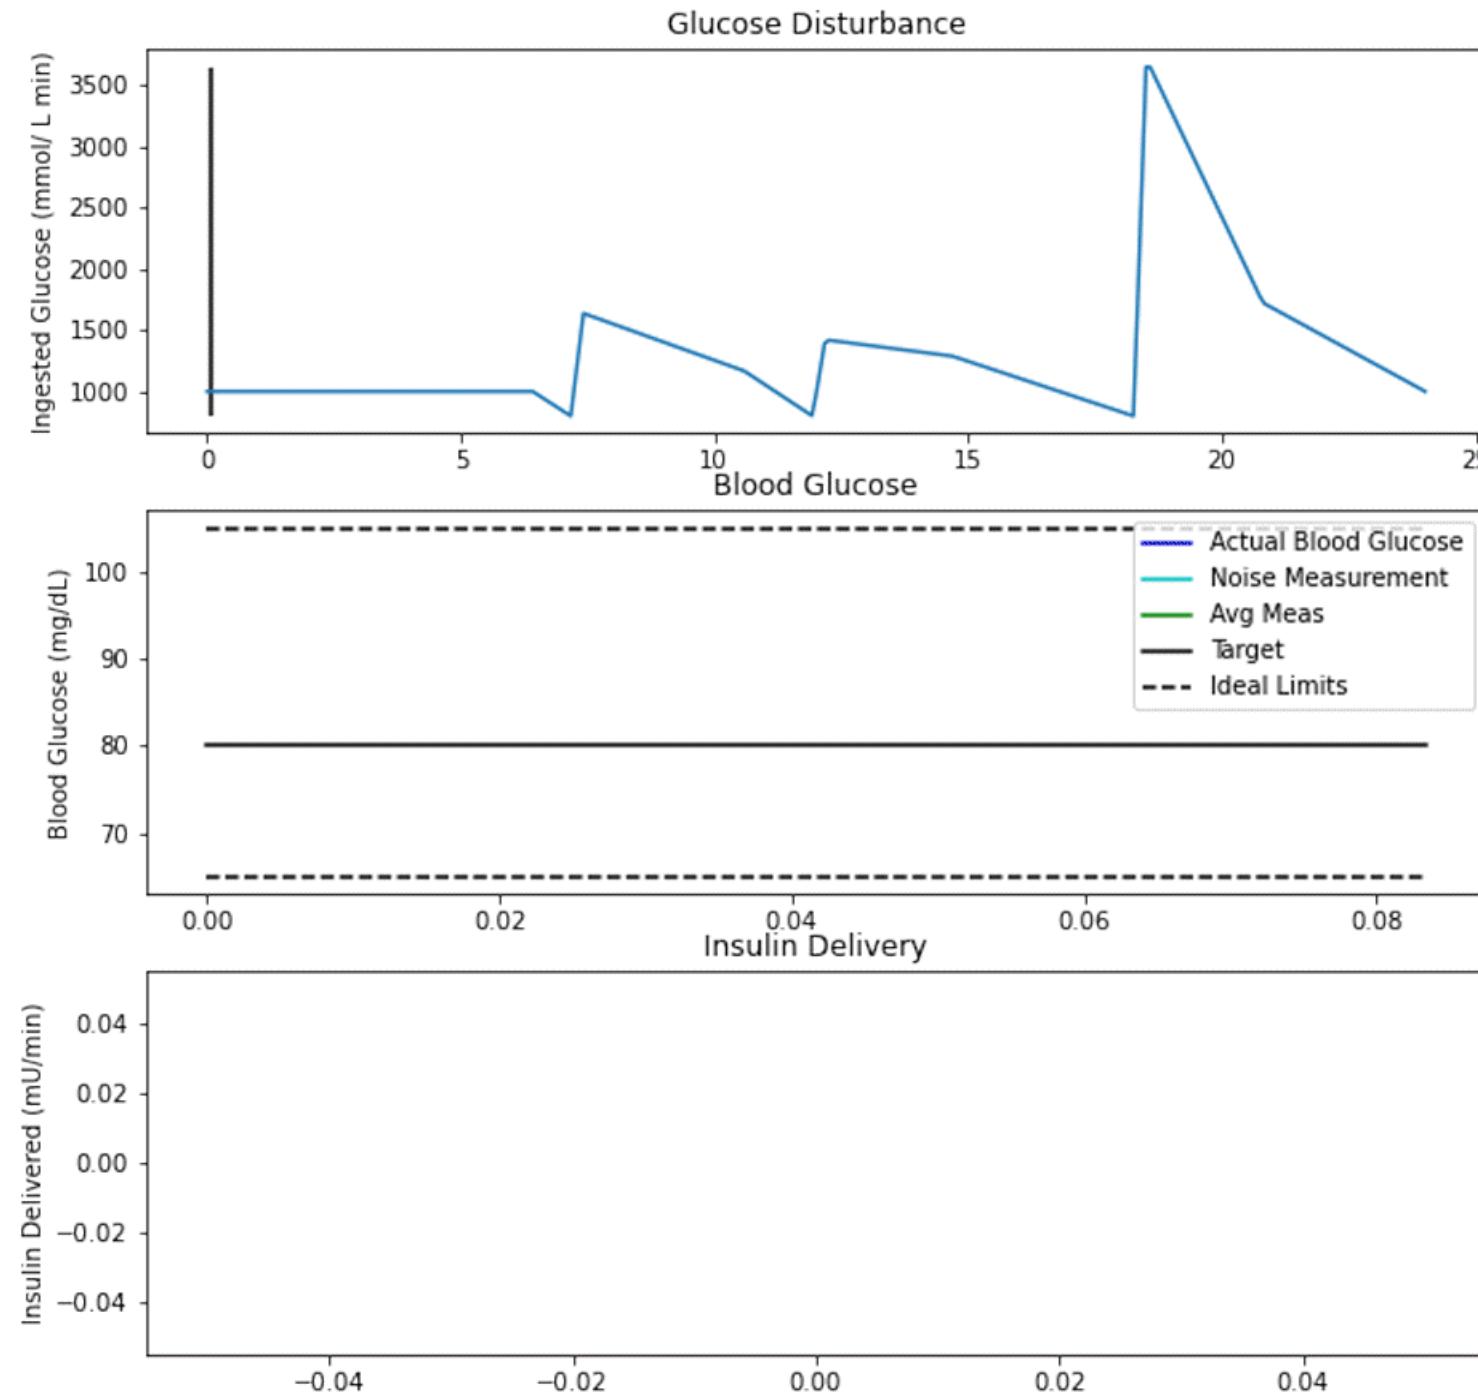

MPC: Objective Function

Objective Function Results

Objective Function	Average Blood Glucose	Average Time Above 105 mmol/dL per day	Average Time Below 65 mmol/dL per day
Plateau	87.30	133.05	121.25
Tanh	101.93	187.70	8.85
Tanh + lower Penalty	86.34	123.70	10.45
2(Tanh) + Lower Penalty	86.42	124.70	8.70
